Features

1. Space-saving
   Reduction in space is achieved by designing the contacts in 2-row staggered 1mm pitch on the mating side and on a single row 0.5mm pitch on the termination side (Fig.1).

2. Equal length transmission lines
   Contact configuration provides equal length transmission lines, which prevents LVDS signal loss within the connector.

3. Variations
   Availability of shielded and non-shielded types allows for design flexibility and cost reduction.

4. Self alignment and self-guiding
   Built-in guide posts allow secure self-alignment within ±1.5mm (Fig.2).

5. Secure and complete mating / unmating
   Side latch locking provides complete and secure mating, as well as easy unmating (Fig.3).

6. Enhanced shielding performance with FX15S
   Enlarged metal shields prevent intrusion and emission of electromagnetic interference, which enhances the integrity of the LVDS signal (Fig.4).

7. RoHS compliant
   All materials and substances used to produce this product comply with RoHS standards.

---

In cases where the application will demand a high level of reliability, such as automotive, please contact a company representative for further information.
## Product Specifications

## Receptacles

● Vertical, with shielding (FX15-31S-0.5SV)

---

### Part No. | HRS No. | No. of contacts | RoHS
---|---|---|---
FX15-31S-0.5SV (**)** | 575-2201-7 ** | 31 | Yes

---

**Recommended PCB mounting pattern and metal mask dimensions**

---

Note 1: The co-planarity of the terminal leads is as follows:
- All signals and shield leads “c” and “d”: 0.1mm max.
- Shield leads “a”, “b”, “e” and “f”: 0.15mm max.

2: Area indicated by the crosshatched lines must be free of conductive traces or the conductive traces must be covered by resist film.

3: Packaged on tape-and-reel.

4: Dimensions in parenthesis ( ) are reference dimensions.
FX15 Series ● 1mm Pitch Wire-to-Board Connectors supporting LVDS signal

Right angle with shields – enhanced shielding (FX15S-**S-0.5SH)

Recommended PCB mounting pattern and metal mask dimensions

Note 1: The coplanarity of the terminal leads is 0.1mm max. for all signal leads and 0.15mm max. for the shield leads.

Note 2: Do not place any components in the area indicated. Placement of components in this area may affect mating and latch lock operation.

Note 3: Area indicated by the cross-hatched lines must be free of conductive traces or the conductive traces must be covered by resist film.

Note 4: The area marked indicates vacuum pick-and-place area for board placement with automatic equipment.

Note 5: Vacuum pick-up area

Note 6: Packaged on tape-and-reel.

Note 7: Dimensions in parenthesis ( ) are reference dimensions.

Unreeling direction
Recommended temperature profile

![Recommended temperature profile graph](image)

**HRS test conditions**
- Test board: Glass epoxy, 40mm × 30mm × 1mm thick
- Solder method: Reflow
- Solder composition: 96.5% Sn/3% Ag/0.5% Cu
- Metal mask: 0.12mm thick
- Reflow cycles: 2 cycles

The temperature profile is based on the above conditions.
In individual applications, the actual temperature may vary, depending on solder paste type, volume/thickness, and board size/thickness. Consult your solder paste and equipment manufacturer for specific recommendations.

**Note:** The temperature profile indicates the maximum temperature of the connector surfaces at the highest point from the PCB mounting surface.

Washing Conditions

**Organic Solvent Washing**

<table>
<thead>
<tr>
<th>Solvent type</th>
<th>Room temperature washing</th>
<th>Heated washing</th>
</tr>
</thead>
<tbody>
<tr>
<td>IPA (Isopropyl alcohol)</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Water Type Washing**

When using water type cleaning agents (e.g., terpene, and alkali saponifiers), select the cleaning agent based on the documentation issued by the various manufacturers of cleaning agents which describes the effects on metals and resins. Be careful that parts are not left with moisture remaining on them.

**Washing Precautions**

Residual flux or cleaning agent on the contacts when washing with organic solvents or water type cleaners can give rise to the deterioration of electrical performance. In this regard, it is important to check whether a thorough washing has been performed.
### Precautions and recommendations

**Wire termination**

The following documents will be needed in order to perform the cable terminations.

1. Basic cable termination and crimp requirements (general explanations).
2. Contact crimp termination machine instruction manual (Explanation of the press)
3. Applicator parts installation table (Applicator installation explanation)
4. Crimp conditions table (Crimp height/Tensile strength standard values)
5. Crimp quality fundamentals manual (Bell-mouth dimensions, bent up, bent down, rolling, etc.)

* Correct cable preparation and crimp termination is based on understanding and following the procedures in the above documents.

**Insertion of the crimp contacts in the housing**

Crimp contacts are inserted in the housing as illustrated below.

Exercising caution when inserting, align the retention tab of the contact with the corresponding molded-in lance in the housing’s contact cavity and push the contacts in. Make sure that the contact is fully inserted and the retention tab clears the molded-in lance.

![Diagram of Insertion](image-url)

**Verify that the retention tabs clear the molded-in lances as shown on the illustration below.**

![Verification Diagram](image-url)

Light pull on the wire, with force NOT EXCEEDING 3N will also verify the correct contact insertion.

**Removal of the contacts**

Using sharp-pointed tool of appropriate size gently lift the molded-in tab and pull-out the terminated contacts. Exercising caution as NOT to damage the molded-in lance. Should the damage occur, the entire housing will need to be replaced.

![Removal Diagram](image-url)
Precautions and recommendations

[Soldering precautions related to FX15S-**P-C connectors]

◆Grounding Methods of the ground wire or shields for the cable assemblies
①Solder the ground wire or the shields ONLY in the areas specifically designated for this purpose, as shown on the illustrations below.
②Observe the soldering iron tip temperature and soldering time specified.
③Do not apply excessive force to the connector by pressing it with the tip of a soldering iron.
④Do not splatter the flux from the solder core.

![Grounding Methods Diagram](image-url)
Precautions and recommendations

Cautions for soldering

1. For the micro coaxial cable assembled to this connector, cable alignment process as shown in “Recommended cable” on the page 1 is required before assembly.

1. Width of ground bar shall be 1.05mm Max. including misalignment of overlapping, flush by cutting, side drop or soldering. Using an inadequate cable will interfere the assembly to the connector. Forceful assembly and soldering could cause mis-soldering and damage the product.

2. Minimize the length of outer conductor beyond the ground the bar.

3. Length of cutting the extra cable should be 2.1mm Max. Any longer cable may cause contact with the connector during assembly and could damage the product. Recommended minimum length is 2.0mm, but this can be altered as long as good soldering ability is maintained.

4. Pre-solder and coat the inner conductor at the cable end.

2. Recommended solder for the assembly is flux cored solder with 0.2mm dia. (Lead-free: Sn-3Ag-0.5Cu), 21mm length. If additional flux is used, make sure to prevent wicking onto the contact area. Wicking onto the contact area will cause the contacts to fail.

3. Before soldering the cable and connector with a cable assembly machine, check the points to avoid below.

1. Misalignment of cable end to the terminals in pitch direction

2. Excessive floating of cable end

4. Follow the recommended temperature profile shown below for the soldering.

The optimum conditions for soldering can vary depending on cable type and length, and solder type. Be sure to check the recommended temperate profile and adjust the conditions accordingly.

Precautions and recommendations

5. After soldering, check that no defect is found at soldered area. Examples of correct soldered and defective soldered state are shown below.

[ Cautions for potting process ]

1. Protect the soldered area by UV cured resin (referred as “potting” hereafter), in order to prevent cable breakage during cabling and other issues.

2. Apply 3033 manufactured by THREEBOND CO., LTD. or any equivalent product for potting. Follow the instruction of the potting manufacturer for UV curing exposure.

3. Refer to the following conditions the potting area.

4. Use extreme care in handling the soldered and potted assembly. Too much stress applied to the cable could break it.
## Precautions and recommendations

### [Cautions for ground plate assembly]

1. Attach a ground plate separately provided as FX15S-41P-GND after the cable assembly process.

2. Place the ground plate onto the connector horizontally and pinch the two components from top and bottom with your fingers.

   - Assembly
   - Horizontally from the top
   - Pinch with fingers

3. Check the six fitting points after assembly and make sure that they are all correctly fitted together.

   - How to check fitting points
     - (Cut section of fitting points)

   - Ground plate hooks the protrusion of connector housing
   - Ground plate does not hook the protrusion of connector housing

   - OK
   - NG

### [Soldering to ground plate]

1. Solder down the metal bar of the cable and ground plate after the assembly of the ground plate to enhance grounding capability and to protect against vertical cable pull forces.

   - Soldering
   - Soldering
Precautions and recommendations

◆ Packaging of the complete cable assemblies
Exercise caution as not to tangle, twist or deform the complete cable assemblies when packaging. Special care should be taken NOT to apply any excessive stress to the individual wires. When removing the cable assemblies from the packaging do not pull on the wires. Make sure that the latch-locks are not interfering with packaging.

◆ Mating of the connectors
These connectors have a built-in polarizing feature and will NOT mate when reversed. Do NOT try and force them together. Align the connectors as shown on the illustration below and fully insert the plug into the receptacle. Confirm that both latch-locks are fully engaged.

Additionally, this connector is equipped with reverse-insertion preventing mechanism, but a forced mating with a minimum force of 25N could damage the connector. Avoid any inappropriate mating, and perform the mating operation after checking the above-mentioned polarity indication.

◆ Treatment after mating has been completed
After mating, please take care to prevent any stress or load on the connector during the routing of cables. If a load of a minimum of 5N is applied on the cable, the cable (crimp contact) could come off. Further, if the entire cable is pulled with a minimum force of 20N, the connector could be broken. Please take extra care not to pull the cable and cause cable disconnection.

If you use a small gauge coaxial plug, a repeated rotation could also cause cable disconnection. Do not use the cable by rotating it repeatedly. The rotation times should be limited to a maximum of 10 even if rotation is required for routing. If your use requires folding back of the cable over the base of the connector, make sure to maintain a large turn-back radius away from the connector base.

Pulling in the horizontal direction: Not acceptable  
Pulling in the vertical direction: Up to a maximum of 10 times  
Rotation in the vertical direction: Up to a maximum of 10 times  
When you use the cable by turning it back  
Keep the turn-back position away from the root of the connector.
Precautions and recommendations

- Handling of Connectors after Mating
  Do not apply excessive force to the connectors when routing the cable after mating. Pulling on the entire cable with a force of 20N or greater can damage the connector. Please take care not to pull the cable.

- Un-mating of the connectors
  Equally depress both sides of the latch-locks as shown on the illustration and pull the plug straight out. Do not pull on the cables!

1. Press
2. Pull straight back.

Lock latches

Press

Press

Do not apply excessive force to the connectors when routing the cable after mating. Pulling on the entire cable with a force of 20N or greater can damage the connector. Please take care not to pull the cable.

Equally depress both sides of the latch-locks as shown on the illustration and pull the plug straight out. Do not pull on the cables!
Technical Information (FX15S Series)

Eye Pattern Waveforms (700MHz)

Shielding Effectiveness (Shielding Characteristics Comparison Using a 2-chamber Shielded Room)

Measured shielding effectiveness for frequencies from 100MHz to 2GHz.

Shielded connectors show noise suppression of 10db to 20dB, when compared with connectors without the shields.

Notes:
The measurement value of “Without plug-side shields + Without receptacle-side shields” are taken as the zero level of the graph vertical axis dB.
The respective results express the noise suppression effect (dB) as a relative comparison value to the “without shields” condition as the reference.
